Readers were more than enthusiastic about the topic. Is there a better way to make money with computers than to develop software, such as computer programs? When I first started programming, there were very few books available, so I started the first one. My buddy is currently developing the second, it's called "Co-Op Programming for Computer Games." Why did you decide to start to develop this software? When I started developing software, there were very few books available, so I started the first one. My buddy is currently developing the second, it's called "Co-Op Programming for Computer Games." What is your day-to-day work like? I get my morning coffee and have breakfast, and then it's a lot of meetings with other programmers. From 1:00 to 3:00, I work on programming. After that I get my lunch and head back to my desk for more programming. I have programming until 9:00 and the company keeps me here until 3:30 or 4:00. If you were to compare Autodesk's software with the competition, where would you place Autodesk among the other competitors? I would say on the bottom of the totem pole. How has your approach to Autodesk development evolved over the years? In the beginning, I was pretty hardcore in my programming. I read all of the literature on the programming language I was using. I would read the assembly language manual and get into programming classes where you actually learned how to do it. Now, I don't have time to do all that. I use a lot of generic programming, but not as much as I used to. Before, I'd be making it something really specific. Now, it's more modular. How do you make it easier for other programmers to work on your code? It's pretty easy because my mainframe is a compact, IBM-compatible and I have a lot of generic commands. Even so, if I'm looking at somebody else's code, I'll see something that I can do that they haven't, but if I try to do it, I find that I'm lost and I can't find what I want. I'm more of an application programmer than a system programmer. I used to like the old COBOL, but I don't like that. My programming has changed a lot. What are the common programming errors

On the valley floor, below a forest of cattle grazing amid fields of red corn, Marcial Atoche, a farmer and chief of the Miravite culture, patiently explains why he needs to have electricity. His body is frail but his voice is determined and forceful as he talks to a reporter from the New York Times who has come to observe and film the development of a community-led energy project in an area known as the "battle for the light". "We have to be connected to the grid because we need to be part of this global network," he said, adding that electricity was also vital for the computerised irrigation system that would ensure the water supply. It is a difficult process in a remote location, but Atoche is already beginning to see benefits. He points to a machine that blows cold air on visitors who have come to witness the progress of this community-led initiative. The Miravite community's ambitious plan has led to the construction of a small hydroelectric plant that will create energy for local homes and businesses. The area is a UNESCO world heritage site and while much of the surrounding region remains poor and rural, some parts are already thriving with tourist attractions such as the Amazon river on the road to Machu Picchu, an Inca citadel. The community's leaders hope the project will be replicated elsewhere. Marcial Atoche (left) and his daughter, Danzaylla, who joined him at a camp to discuss the project.
